

What's MVC?

Separation of Concerns

Module Summary

Model

- Responsible for representing your data
- Responsible for managing your data (saving, fetching, ...)
- Doesn't matter if you manage data in memory, files, databases
- Contains data-related logic

Controller

- Connects Model and View
- Should only make sure that the two can communicate (in both directions)

View

- What the user sees
- Shouldn't contain too much logic (Handlebars!)
